"protected" members

Code Smell

Underscores should be used to make large numbers readable

Code Smell

"ToString()" calls should not be redundant

Code Smell

"==" should not be used when "Equals" is overridden

Code Smell

An abstract class should have both abstract and concrete methods

Code Smell

Multiple variables should not be declared on the same line

Code Smell

Culture should be specified for "string" operations

Code Smell

"switch" statements should have at least 3 "case" clauses

Code Smell

break statements should not be used except for switch cases

Code Smell

String literals should not be duplicated

Code Smell

Files should contain an empty newline at the end

Code Smell

Unused "using" should be removed

Code Smell

Fields should not have public accessibility

Analyze your code

Code Smell Minor cwe

Public fields in public classes do not respect the encapsulation principle and has three main disadvantages:

- Additional behavior such as validation cannot be added.
- The internal representation is exposed, and cannot be changed afterwards.
- Member values are subject to change from anywhere in the code and may not meet the programmer's assumptions.

By using private fields and public properties (set and get), unauthorized modifications are prevented. Properties also benefit from additional protection (security) features such as Link Demands.

Note that due to optimizations on simple properties, public fields provide only very little performance gain.

Noncompliant Code Example

```
public class Foo
{
    public int instanceData = 32; // Noncompliant
}
```

Compliant Solution

```
public class Foo
{
    private int instanceData = 32;

    public int InstanceData
    {
        get { return instanceData; }
        set { instanceData = value ; }
    }
}
```

Exceptions

Fields marked as readonly or const are ignored by this rule.

Fields inside classes or structs annotated with the StructLayoutAttribute are ignored by this rule.
