Code Smell Major Quick Fix confusing

readonly fields can only be assigned in a class constructor. If a class has a field that's not marked readonly but is only set in the constructor, it could cause confusion about the field's intended use. To avoid confusion, such fields should be marked readonly to make their intended use explicit, and to prevent future maintainers from inadvertently changing their use.

## Noncompliant Code Example

```
public class Person
{
    private int _birthYear; // Noncompliant

    Person(int birthYear)
    {
        _birthYear = birthYear;
    }
}
```

## Compliant Solution

```
public class Person
{
    private readonly int _birthYear;

    Person(int birthYear)
    {
        _birthYear = birthYear;
    }
}
```

## Exceptions

- Fields with attributes are ignored.
- Fields of type struct that are not primitive or pointer types are also ignored because of possible unwanted behavior.

## See

- Mutating readonly structs
